

We all strive to provide excellent health care for each of our patients.

Keeping abreast of current trends in diagnostic imaging can be a challenge, especially with the wide range of options available. I hope this CD helps you decide on the right test for your patient, whether they have as yet undiagnosed disease, or known Crohn's/Ulcerative Colitis.

Dr. Justin Amann
Staff, Radiologist

Crohn's disease and ulcerative colitis are common, chronic and relapsing disorders that can affect patients in all age groups. Accurate diagnosis in the first instance and assessment of response to therapy is accomplished through imaging modalities that together display the spectrum of the structural and functional consequences of these disease processes. This presentation will guide physicians in the best utilization of GI radiology and white blood cell scintigraphy to these ends.

Dr. Albert Driedger
Staff, Nuclear Medicine
