Tomorrow Today

# OrthoWorks

**SIGNA™ Works**  
Fueling the future of MR

# SIGNA™Works

The new standard is extraordinary

Our new SIGNA™Works productivity platform redefines productivity across the breadth of our core imaging techniques. It takes full advantage of Total Digital Imaging (TDI), further advancing diagnostics and quickening throughput, while improving patient outcomes and your ROI. It is upgradeable and customizable with additional applications to suit your growing practice.

## Standard Applications

Energize your clinical capabilities with all the tools you need to complete an exam. Imaging solutions cover a variety of contrasts, 2D and 3D volumetric data and motion correction capabilities.

 [find out more](#)

## Innovative Applications

Expand your expertise to the next level, to deliver improved image quality, higher efficiency and a more streamlined workflow, so you perform better than ever before.

# SIGNA™Works

The new standard is extraordinary

## ► Standard Applications Innovative Applications

### **BodyWorks**

One of the fastest growing areas in MR, BodyWorks allows you to image abdominal and pelvic anatomy with user flexibility to adapt to different patient types.

### **CVWorks**

Gain crucial insights into vascular structure and flow dynamics and access morphology, flow, function and tissue viability with CVWorks.

### **NeuroWorks**

This one-stop solution enables you to image brain, spine, vascular and peripheral nerve anatomy with exceptional tissue contrast.

### **OncoWorks**

Delivers robust tissue contrast, motion-insensitive, high temporal and spatial resolution imaging techniques that capture anatomical and morphological data for oncological assessment.

### **OrthoWorks**

This extensive library of musculoskeletal imaging techniques enables you to image bone, joint and soft tissue with remarkable tissue contrast.

### **PaedWorks**

Delivers distinctive child-centered imaging techniques that provide ease of use for the user and clinical excellence for your smallest, most fragile patients.

# SIGNA™Works

The new standard is extraordinary

## Standard Applications

### ► **Innovative Applications**

#### **HyperWorks**

HyperWorks means hyper scanning with astonishing imaging and impressive speed. It includes HyperSense, which can deliver higher spatial resolution images or reduced scan times.

#### **ImageWorks**

ImageWorks boosts your overall MR performance. READYView visualization and MAGiC one-and-done scanning help ensure consistent and clear results.

#### **SilentWorks**

SilentWorks is GE's most advanced noise reducing technology. Traditional exams can be extremely loud. SilentWorks brings the sound level down to ambient noise.

#### **ViosWorks**

ViosWorks reduces the complexity and cost of cardiac imaging. For the first time, all 7 dimensions of information can be captured in a cardiovascular scan in 10 minutes or less.

# OrthoWorks

The OrthoWorks package is an extensive library of musculoskeletal imaging techniques that provide dynamic imaging of bone, joint and soft tissue with remarkable tissue contrast.

OrthoWorks

**Standard Applications**

# PROPELLER

PROPELLER Multi-Blade (MB) is a multi-shot approach that preserves tissue contrast regardless of weighting while also reducing motion artifacts and providing a more signal-rich image. Additionally, this technique allows for all contrasts for 2D FSE: T1, T2, STIR and PD weightings.

## Clinical benefits:

- Delivers motion-artifact-free diagnostic images for voluntary and involuntary patient motion
- Increases productivity and decreases the number of repeated scans
- Enables sedation-free scanning and increases patient tolerance

Standard FSE

PROPELLER FSE

OrthoWorks

## Standard Applications

# Cube

Cube is our 3D volumetric imaging technique that can easily be reformatted into any plane. The SNR-rich submillimeter slices can provide partial volume averaging effect which helps to visualize even small and subtle abnormalities.

### Clinical benefits:

- Scan once, then reformat to any plane with high sub-millimeter resolution
- Combines with ARC acceleration to reduce scan times
- Spatial anatomical localization for abnormalities
- Higher slice resolution compared to 2D imaging
- Can decrease flow artifacts

OrthoWorks

## Standard Applications

# MERGE

Multi-Echo Recalled Gradient Echo (MERGE) uses multiple TE's to generate superior contrast and visualization of the different layers of cartilage in MSK imaging and better definition of gray/white matter in the spine. It can be acquired in 2D or in 3D with excellent spatial resolution, includes water excitation for elimination of fat, and maintains ligament visualization while adding soft tissue contrast.

### Clinical benefits:

- Distinguishes femoral and acetabular cartilage in the hip
- Helps visualize scaphoid fractures and delineation of ligaments in the wrist

3D MERGE

3D MERGE

3D GRE

OrthoWorks

## Standard Applications

# 2D FSE

FSE is a standard imaging technique that accelerates scan time based on Echo Train Length. It also produces sharp and crisp images with familiar contrasts, including PD, T1, T2 and STIR weightings. ARC and ASSET can be used to further accelerate scan times.

### Clinical benefits:

- Fast, high resolution images with sharp edge detail
- Gold standard for MSK imaging
- Compatible with Flex for areas that are difficult to FatSat, such as ankles, toes and fingers

Osteochondritis dissecans

PD FatSat Coronal 0.4 x 0.6 x 2mm  
3:22 min

PD Coronal 0.3 x 0.6 x 2mm  
2:46 min

OrthoWorks

**Elective Applications**

# FSE Flex

Fast Spin Echo (FSE) Flex uses a 2-point Dixon technique that provides homogenous fat separation with water, fat, in-phase and out-of-phase images in a single scan. It provides robust imaging where chemical FatSat can fail, even in difficult-to-scan anatomies such as the feet, spine, hips, neck, hands and fingers.

**Clinical benefits:**

- Acquires multiple contrasts in a single scan, reducing need for multiple acquisitions
- Compatible with 2D and 3D imaging, which is helpful in challenging off-isocenter anatomies or larger fields of view
- Combines with ARC acceleration to reduce scan times

# Case Study: Assessing Axillary Lesion with FSE Flex

**Clinical solutions**

System: Discovery™ MR750w GEM

**Protocols used**Axial T2 FSE Flex, Axial FOCUS DWI,  
Coronal T2 FSE Flex**Patient history**

A 90-year-old patient with a known squamous cell carcinoma in the axilla was examined.

**Procedure**

FSE Flex and FOCUS DWI were used through the area of interest. Post contrast images included FSE Flex and 3D Turbo LAVA. Data was post-processed with READYView.

**MR findings**

With a previous diagnosis of squamous cell carcinoma, the lesion in the axilla could be a metastatic lesion from this or a new cancer. The results from the MR scan changed the course of treatment to determine the appropriate therapy for an axilla lesion.

**Elective Applications**

# Case Study: Imaging the Hand with FSE Flex

**Clinical solutions**

System: SIGNA™ Pioneer 3.0T

Coil: GEM Flex Small Coil

**Protocols used**

Coronal T1, Coronal STIR, Sagittal T2,

Axial PD FatSat, Axial PD Flex,

Axial T1 Flex (pre and post),

Coronal T1 Flex (pre and post)

**Patient history**

A 78-year-old patient presented with pain and swelling in their hand following a scratch to the forearm. Patient had an embedded piece of steel in the affected hand from 30 years prior. Metal artifact was not able to be removed.

**Procedure**

Using FSE Flex greatly enhanced diagnostic confidence due to poor saturation caused by the steel artifact, and also saved time.

**MR findings**

The specific source of infection was not determined but would have been deemed inconclusive if we were unable to obtain homogeneous fat saturation. Diagnostic confidence is greatly improved in the presence of tissue susceptibility.

**Elective Applications**

# MAVRIC SL

Multi-acquisition with Variable Resonance Image Combination SeLective (MAVRIC SL) is an advanced technique designed to greatly reduce artifacts while imaging soft tissue and bone near MR conditional metallic devices. It also acquires different offsets to remove metal implant distortions.

## Clinical benefits:

- Evaluates arthroplasty complications
- Acquires several 3D FSE images to produce a single composite image
- Visualizes fluid near an implant

T1 MAVRIC SL

STIR MAVRIC SL

STIR MAVRIC SL

case study A

case study B

OrthoWorks

## Elective Applications

# Case Study: Imaging Hip Replacement with MAVRIC SL

### Protocols used

Coronal T1 MAVRIC SL, Coronal STIR MAVRIC SL, Axial STIR MAVRIC SL

### Patient history

A patient presented with pain and an infection in the pelvic region.

### MR findings

MAVRIC SL sequences clearly demonstrated inflammatory changes surrounding the right hip replacement and a moderate effusion in the right hip. The right prosthesis was protruding outside the right femoral stem and there was an infection in the right hip joint.

MAVRIC SL helped to determine that an orthopedic surgeon, not a vascular surgeon, was need for hip revision surgery.

Coronal T1 MAVRIC SL

Coronal STIR MAVRIC SL

Axial STIR MAVRIC SL

OrthoWorks

**Elective Applications**

# Case Study: Assessing Metal Particle Disease with MAVRIC SL

## Clinical solutions

System: Optima™ MR450w

## Protocols used

Axial PD MAVRIC, Axial STIR MAVRIC, Coronal T1 MAVRIC, Coronal STIR MAVRIC

## Patient history

An elderly patient presented with swelling and pain. Damage was indicated to the metal prosthesis.

## MR findings

A large collection of fluid was seen around the arthroplasty, which is an adverse local tissue reaction from a failed implant. Debris, believed to be metal deposits from the prosthesis, was shown floating in the fluid. This is due to re-absorption of metal on metal hip replacements.

OrthoWorks

**Innovative Applications**

# HyperSense

HyperSense is an acceleration technique based on sparse data sampling and iterative reconstruction, that delivers higher image resolution or reduced scan time, without the typical penalties of conventional parallel imaging. It is combined with ARC acceleration to maintain high SNR with shorter acquisition times.

**Clinical benefits:**

- Lowers scan time, without reducing SNR
- Achieve outstanding resolution in the same amount of time
- Provides faster 3D imaging acquisitions

Original scan without HyperSense  
Sagittal Cube PD FS,  $0.6\text{mm}^3$   
6:03 min

With HyperSense for reduced scan time  
Sagittal Cube PD FS,  $0.6\text{mm}^3$   
HyperSense factor = 2 3:03 min

With HyperSense for improved spatial resolution  
Sagittal Cube PD FS,  $0.5\text{mm}^3$   
HyperSense factor = 2 4:06 min

With HyperSense for improved spatial resolution  
Sagittal Cube PD FS,  $0.4\text{mm}^3$   
HyperSense factor = 2 5:52 min

OrthoWorks

**Innovative Applications**

# HyperCube

HyperCube reduces scan time and limits artifacts such as motion and aliasing by reducing the phase FOV. It can be applied with or without fat suppression and significantly lowers imaging time without sacrificing contrast quality. It focuses on the area of interest, can be used on the entire body and is compatible with HyperSense.

## Clinical benefits:

- Lowers scan time without SNR loss, reducing the potential for patient motion and repeats
- Eliminates time-consuming parameters
- Provides high-resolution small FOV imaging
- Helps with large FOV robust fat suppression when combined with FSE Flex

HyperCube with HyperSense 2:36 min
