A mandatory component of this drawing set is the GE Healthcare Pre Installation manual. Failure to reference the Pre Installation manual will result in incomplete documentation required for site design and preparation. Pre Installation documents for GE Healthcare products can be accessed on the web at: www.gehealthcare.com/siteplanning

GE does not take responsibility for any damages resulting from changes on drawings made by others. Errors may occur by not referring to the complete set of final issue drawings. GE cannot accept responsibility for any damage due to the partial use of GE final issue drawings, however caused. All dimensions are in millimeters unless otherwise specified. Do not scale from printed PDF files. GE accepts no responsibility or liability for defective work due to scaling from these drawings.

CUSTOMER RESPONSIBILITIES

It is the responsibility of the customer to prepare the site in accordance with the specifications stated in the final study. A detailed site readiness checklist is provided by GE. It is the responsibility of the customer to ensure all requirements are fulfilled and that the site conforms to all specifications defined in the checklist and final study. The GE Project Manager of Installation (PMI) will work in cooperation with the customer to follow up and ensure that actions in the checklist are complete, and if necessary, will aid in the rescheduling of the delivery and installation date.

Prior to installation, a structural engineer of record must ensure that the floor and ceiling is designed in such a way that the loads of the installed system can be securely borne and transferred. The layout of additional structural elements, dimensioning and the selection of appropriate installation methods are the sole responsibility of the structural engineer. Execution of load bearing structures supporting equipment on the ceiling, floor or walls are the customer’s responsibility.

DISCLAIMER

GE is not responsible for the installation of developers and associated equipment, lighting, cassette trays and protective screens or derivatives not mentioned in the order.

The layout of the equipment offered by GE, the dimensions given for the premises, the details provided for the pre-installation work and electrical power supply are given according to the information noted during on-site study and the wishes expressed by the customer.

The room dimensions used to create the equipment layout may originate from a previous layout and may not be accurate as they may not have been verified on site. GE cannot take any responsibility for errors due to lack of information.

Dimensions apply to finished surfaces of the room.

Actual configuration may differ from options presented in some typical views or tables.

If this set of final drawings has been approved by the customer, any subsequent modification of the site must be subject to further investigation by GE about the feasibility of installing the equipment. Any reservations must be noted.

The equipment layout indicates the placement and interconnection of the indicated equipment components. There may be local requirements that could impact the placement of these components. It remains the customer’s responsibility to ensure that the site and final equipment placement complies with all applicable local requirements.

All work required to install GE equipment must be carried out in compliance with the building regulations and the safety standards of legal force in the country concerned.

These drawings are not to be used for actual construction purposes. The company cannot take responsibility for any damage resulting therefrom.
CUSTOMER SITE READINESS REQUIREMENTS

- Any deviation from these drawings must be communicated in writing to and reviewed by your local GE healthcare installation project manager prior to making changes.
- Make arrangements for any rigging, special handling, or facility modifications that must be made to deliver the equipment to the installation site. If desired, your local GE healthcare installation project manager can supply a reference list of rigging contractors.
- New construction requires the following:
  1. Secure area for equipment,
  2. Power for drills and other test equipment,
  3. Capability for image analysis,
  4. Restrooms.
- Provide for refuse removal and disposal (e.g. crates, cartons, packing)
- It is the customer’s responsibility to contract a vibration consultant/engineer to implement site design modifications to meet the GE vibration specification. Refer to the system preinstallation manual for the vibration specification.
- New construction requires the following:
  1. Secure area for equipment,
  2. Power for drills and other test equipment,
  3. Capability for image analysis,

MAGNETIC INTERFERENCE SPECIFICATIONS

- The customer must establish protocols to prevent persons with cardiac pacemakers, neurostimulators, and biostimulation devices from entering magnetic fields of greater than 5 gauss (exclusion zone).
- Main power transformers must remain outside the 3 gauss field. EMI < 17.1mG AC. EMI < 4.1mG DC.
- Potential exists under fault conditions that the 5 gauss line may expand radially to 19.68 ft. [6.0 m] and axially to 24.61 ft. [7.5 m] for 100 seconds. It should be noted that normal rampdowns or magnet rundown unit initiated quenches will not cause the magnetic field to expand.
- It is recommended every site consider the event of a quench and plan accordingly (such as placing 5 gauss warning signs at expanded locations).
- The ferrous metal objects listed below must not move into or inside of the moving metal sensitivity line during scans.

MRI SITE PLANNING REMINDERS

Please refer to pre-installation checklist in pre-installation manual listed on the cover sheet for items critical to image quality.

1. The layout should be arranged so that the 5g line is contained to the magnet room. If not possible, a barrier is recommended to prevent entry to the 5g field area.
2. The spaces around, above, and below the magnet must be reviewed for effects of the 5g, 3g, 1g, and .5g fields. Refer to the proximity limit chart in the MR pre-installation manual referenced on the cover sheet.
3. For moving metal, the restriction lines typically extend outside of the MR space. Please confirm there are no moving metal concerns within these areas. An EMI study is recommended if the restriction lines are violated.
4. For vibration, analysis to be completed as required per pre-installation manual.
5. For EMI, review the site for the location of the main electrical feeders, AC devices, or distribution systems. An EMI study is recommended if large AC systems are nearby.
6. Details of the floor below the magnet must be reviewed. The structural engineer must verify that the quantity of steel in the volume 10ft [3.1m] x 10ft [3.1m] x 1ft [.3m] deep (below the magnet) does not exceed the allowable steel content as given in the MR pre-installation manual referenced on the cover sheet.
7. All access/computer flooring is to be removed in both the magnet room and equipment room.

Responsibility for the coordination, design, engineering, and site preparation resides with the customer and their project architects and contractors. GE does not, by providing reviews and furnishing comments and assistance, accept any responsibility beyond its obligations as defined in the MR system, sale/purchase agreement.

IMAGE QUALITY CONSIDERATIONS

Broadband RF noise is a single transient or continuous series of transient disturbances caused by an electrical discharge. Low humidity environmental conditions will have higher probability of electrical discharge. The electrical discharge can occur due to electrical arcing (micro arcing) or merely static discharge. Some potential sources capable of producing electrical discharge include:

- Loose hardware/fasteners vibration or movement (electrical continuity must always be maintained)
- Flooring material including raised access flooring (panels & support hardware) and carpeting
- Electrical fixtures (i.e. Lighting fixtures, track lighting, emergency lighting, battery chargers, outlets)
- Ducting for HVAC and cable routing
- RF shield seals (walls, doors, windows etc.)

For additional information regarding image quality, refer to the pre-installation manual listed on the cover sheet.

MAGNETIC INTERFERENCE SPECIFICATIONS

- The customer must establish protocols to prevent persons with cardiac pacemakers, neurostimulators, and biostimulation devices from entering magnetic fields of greater than 5 gauss (exclusion zone).
- Main power transformers must remain outside the 3 gauss field. EMI < 17.1mG AC. EMI < 4.1mG DC.
- Potential exists under fault conditions that the 5 gauss line may expand radially to 19.68 ft. [6.0 m] and axially to 24.61 ft. [7.5 m] for 100 seconds. It should be noted that normal rampdowns or magnet rundown unit initiated quenches will not cause the magnetic field to expand.
- It is recommended every site consider the event of a quench and plan accordingly (such as placing 5 gauss warning signs at expanded locations).
- The ferrous metal objects listed below must not move into or inside of the moving metal sensitivity line during scans.

For additional information regarding image quality, refer to the pre-installation manual listed on the cover sheet.
The GE HPI Technical Support Group is an additional resource that can provide answers for general GE product siting questions and can be reached at (877)-305-9677 or mail to: HPITechCOE@ge.com

**Examination room height**

- Finished floor to slab height: TBD
- Recommended finished ceiling height: 8'-9"
MAGNETIC PROXIMITY LIMITS

The actual field strength can be affected by Magnetic shielding, Earth’s magnetic field, other magnetic fields and stationary or moving metal. This information must be used to evaluate potential site interaction of GE Healthcare equipment with other non-GE Healthcare equipment. Magnetic shielding can be installed to prevent interaction between the magnet and nearby sensitive devices. The GE Healthcare Project Manager of Installation (PMI) can work with the customer to coordinate the magnetic shielding site evaluation. The customer is responsible for installation of all magnetic shielding.

The steel mass limits to magnet isocenter (3x3 m [10x10 ft] area under magnet) are as follows:

<table>
<thead>
<tr>
<th>Steel Mass (kg/m²)</th>
<th>Distance From Magnet Isocenter (mm)</th>
<th>Distance Below Top Surface Of Floor (in)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0 - 1143</td>

<td>1321 - 1397</td>
<td>52 - 55</td>
</tr>
<tr>
<td>98.0</td>
<td>1397+</td>
<td>330+</td>
</tr>
</tbody>
</table>

The customer must provide detail defining ferrous material below the magnet to the Project Manager so the GE Healthcare MR Siting and Shielding team can review for compliance.

ACOUSTICS SPECIFICATIONS

Acoustic and vibroacoustic information is provided for site planning and architectural design activities. It is the customer’s responsibility to hire a qualified acoustic engineer for solutions to further attenuate this transmitted noise and vibration, if required. The actual room noise level may vary based on room design, optional equipment, and usage:

- Control Room: 62dBA
- Equipment Room: 80dBA
- Magnet Room: 127dBA* (maximum sound pressure level at magnet bore isocenter)

* Frequency: 20 Hz to 20kHz

SOUND PRESSURE SPECTRAL DISTRIBUTION

1/3 Band Relative SPL

MAGNETIC PROXIMITY LIMITS

The isogauss contour plots depicted on this drawing represent magnetic fringe fields resulting from the normal operation of the magnet provided with the MR system. The actual magnetic field intensity at any point in the vicinity of the magnet when installed may vary from the contour plots due to factors such as the concentrating effects of nearby ferrous objects ambient magnetic fields, including the Earth’s magnetic field. Therefore, the contours shown are only approximations of actual field intensities found at a corresponding distance from the magnet’s isocenter.

SOUND PRESSURE SPECTRAL DISTRIBUTION

1/3 Band Relative SPL

MAGNETIC PROXIMITY LIMITS

The actual field strength can be affected by Magnetic shielding, Earth’s magnetic field, other magnetic fields and stationary or moving metal. This information must be used to evaluate potential site interaction of GE Healthcare equipment with other non-GE Healthcare equipment. Magnetic shielding can be installed to prevent interaction between the magnet and nearby sensitive devices. The GE Healthcare Project Manager of Installation (PMI) can work with the customer to coordinate the magnetic shielding site evaluation. The customer is responsible for installation of all magnetic shielding.
MINIMUM MAGNET CEILING HEIGHT (TOP VIEW)

Shaded area within solid lines indicates floor to ceiling minimum height of 2500 mm [98.42in]. If ceiling is between 2500 mm [98.42in] and 2667 mm [105in], flexible main lead extension for low ceiling height is required for ramping the magnet. Contact the PMI for preparation.

INTEGRATED COOLING CABINET
Front View

INTEGRATED SYSTEM CABINET
Front View

Equipment room side

Mesh shield frame area

INTEGRATED COOLING CABINET
Top View

INTEGRATED SYSTEM CABINET
Top View

Finished wall

Equipment room

Integrated System Cabinet and Integrated Cooling Cabinet must be covered on both sides for safety.

NOTE:
- All RF mesh Assy Shipping brackets should be kept on frame until after installed and RF test is completed.
- The PEN closet must have a mechanical locking mechanism to restrict access to the PEN panels.
- The PEN closet must maintain the minimum service area outside the 200 Gauss in the magnet room.
- PEN closet must allow free air exchange of 400CFM (680 m³/hour) between the Magnet room and PEN closet for MR system blowers. Airflow may be achieved through door louvers or other openings in the PEN closet that meet all other PEN closet requirements.
Note:
Center of gravity is approximate and includes the GE Healthcare supplied VibroAcoustic Dampening Kit, but does not include cryogens, gradient assembly, side mounted electronics, or enclosures.

Enclosure dimensions are for reference only, NOT FOR SITE PLANNING USE.

Center of gravity
DELIVERY

ROUTING

- The customer is solely liable for routing of components from dock to final site.
- GE must be able to move system components in or out with no need to uncrate or disassemble any of the components. The entire passageway must be cleared, adequately lighted and free from dust.
- The floor and its surfacing must be able to withstand the live load of components and handling equipment.
- Floor surfacing must be continuous.
- The customer must protect any fragile flooring surfaces.

MINIMUM SPECIFICATIONS FOR MAGNET ROUTING

- Floor must be able to withstand a moving load of 7804 kg
- Height: 2.5m [98.5in], width: 2.7m [98.5in]
- Maximum slope: 30°

STORAGE CONDITIONS

- System components except the magnet should be stored in a cleaned room.
- Temperature = -30 to 60°C [-22 to 140°F], relative humidity < 90% non condensing.
- Material should not be stored for more than 90 days.
- The magnet will be delivered after GE validation of the site.

INSTALLATION AND DELIVERY ACCEPTANCE

- A survey of the site established by the customer and GE will make the decision for the delivery time.
- This survey of the site (a form is made available by GE) is only to check if the apparent conditions of the site allow the equipment to be delivered.
- If the site is not ready, GE can delay the delivery time.

CRITICAL ITEMS FOR MAGNET DELIVERY

- 24/7 chilled water and 480v power for shield/cryo cooler
- 24/7 120v power for the magnet monitor
- Phone lines for magnet monitoring and emergency use
- Magnet room exhaust fan
- Cryogen venting (if roof hatch, completed within 24 hrs)

This is only a partial list of items required for delivery of the magnet. For a complete checklist refer to the pre-installation manual referenced on cover sheet.

GRADIENT COIL REPLACEMENT

<table>
<thead>
<tr>
<th>EQUIPMENT</th>
<th>DIMENSIONS LxWxH</th>

</tr>
</thead>
<tbody>
<tr>
<td>Replacement XRM gradient coil assembly</td>
<td>991x2536x1499</td>
<td>1449</td>
<td>lbs</td>
</tr>
</tbody>
</table>

The weight bearing structure of the site should support any additional weight of the main replacement parts occurring during maintenance of the magnet, throughout the whole lifecycle of the MR.
**VIBRATION TRANSMITTED THROUGH VIBROACOUSTIC MAT**

- All units that are wall mounted or wall supported are to be provided with supports where necessary. Wall supports are to be supplied and installed by the customer or his contractors.

- Dimensions are to finished surfaces of room.

- Certain MR procedures require an extremely stable environment to achieve high resolution image quality. Vibration is known to introduce field instabilities into the imaging system. The vibration effects on image quality can be minimized during the initial site planning of the MR suite by minimizing the vibration environment. See PROXIMITY LIMITS, PATIENT TABLE DOCK ANCHOR MOUNTING REQUIREMENTS AND VIBROACOUSTIC DAMPENING KIT details for additional information.

- Standard steel studs, nails, screws, conduit, piping, drains and other hardware are acceptable if properly secured. Any loose steel objects can be violently accelerated into the bore of the magnet. Careful thought should be given to the selection of light fixtures, cabinets, wall decorations, etc. To minimize this potential hazard. For safety, all removable items within the magnet room such as faucet handles, drain covers, switch box cover plates, light fixture components, mounting screws, etc. Must be non-magnetic. If you have a specific question about material, bring it to the attention of your GE project manager of installations.

- Floor levelness refer to MAGNET ROOM FLOOR SPECIFICATIONS DETAIL, this floor levelness requirement is important for accurate patient table docking.

- Non-movable steel such as wall studs or HVAC components will produce negligible effect on the active shield magnet.

- Customers contractor must provide all penetrations in post tension floors.

- Customers contractor must provide and install any non-standard anchoring. Documents for standard anchoring methods are included with GE equipment drawings for geographic areas that require such documentation.

- Customers contractor must provide and install hardware for "through the floor" anchoring and/or any bracing under access floors. This contractor must also provide floor drilling that cannot be completed because of an obstruction encountered while drilling by the GE installer such as rebar etc.

- Customers contractor to provide and install appropriate supports for the storage of excess cables.

- It is the customer’s responsibility to perform any floor or wall penetrations that may be required. The customer is also responsible for ensuring that no subsurface utilities (e.g., electrical or any other form of wiring, conduits, piping, duct work or structural supports (i.e. post tension cables or rebar)) will interfere or come in contact with subsurface penetration operations (e.g. drilling and installation of anchors/screws) performed during the installation process. To ensure worker safety, GE installers will perform surface penetration operations only after the customer’s validation and completion of the “GE surface penetration permit”

MAGNET ROOM FLOOR SPECIFICATIONS

Floor must be flat and level to 3 mm [0.12in] between high and low spots over the area shown.

The finished floor must support the weight of all components (e.g., patient table, gradient coil replacement cart) throughout operation and service life.

1. The RF Shield vendor must design and install the table frame anchor bolt
2. The table frame anchor hole must be drilled after the Magnet is delivered
3. The table frame anchor must not contact floor rebar or other structural steel
4. The table frame anchor must electrically contact the RF shield at point of entry
5. The table frame anchors must have the following properties:
   a. Anchors must be two-part assembly (male/female)
   b. Female side must be expansion- or epoxy-type
   c. Male side must be a bolt or threaded rod with appropriate-sized nut (bolt or rod must be removable - not epoxied or cemented in place)
   d. Anchors must be electrically conductive
   e. Anchors must be non-magnetic
   f. Anchors must not induce galvanic corrosion with the RF shield
   g. Anchors must be commercially procured
   h. The anchor rod hole clearance in the table anchor base is 11 mm (0.43 in). The anchor rod diameter must be sized appropriately
   i. Anchors must meet the following clamping force: 2669 N (600 lbs)
   j. The anchor rod must be less than 152 mm (6 in) in total length (length above the floor plus embedded length)

6. The RF Shield vendor must perform a pull test on the anchor (equal to the clamping force). Results must be provided to the GE Healthcare Project Manager of Installation (PMI).

**MECHANICAL/PLUMBING NOTES**

- All piping, fittings, supports, hoses, clamps, ventilation systems, etc. are to be supplied and installed by the customer or his contractors.
- For complete design and requirements, specifications and guidelines refer to the pre-installation manual: system cooling, cryogen venting, waveguides and exhaust venting.
- An emergency water cooling back-up supply is recommended for continuous cryogen compressor operation. If using an open loop back-up design, ensure a drain is provided. Please refer to the pre-install manual for optional back-up coolant supply requirements.

**PRESSURE VENT REQUIREMENT**

- The pressure equalization vent must be located so any Helium gas is not vented into occupied areas.
- All system components must be accessible for customer inspection, cleaning and maintenance.

**EMERGENCY VENT REQUIREMENT**

- Exhaust fan must be placed above RF shielding located outside 10 gauss (1mT) and with appropriate waveguide.
- The system must have a manual exhaust fan switch near the Operator Workspace and in the Magnet room near the door (the switches must be connected in parallel).
- All system components must be accessible for customer inspection, cleaning and maintenance.

**OPTIONS**

- MR Elastography (MRE) | Equipment | 141 | 480 | 141 | 480 | 141 | 480 |

**MAGNET ROOM EXHAUST FAN SCHEMATIC**

- Vent to outside environment
- RF Shield
- Exhaust Intake Vent
- Ductwork
- Dielectric Isolator
- AC Power (rated as required for operation of Motorized Damper and Exhaust Fan)
- Motorized Damper
- Manual ON/OFF fan switches in parallel
- Exhaust Fan
- Room ceiling
- Ground secondary of low voltage transformer to RF Room Common Ground Stud

**MAGNET ROOM VENTING REQUIREMENTS**

- HVAC Vent Requirements
  - HVAC vendor must comply with Magnet room temperature and humidity specifications and RF shielding specifications.
  - RF Shield vendor must install open pipe or honeycomb HVAC waveguides.
  - All serviceable parts in the Magnet room (e.g.: diffusers) must be non-magnetic.
  - Waveguides must be nonmagnetic and electrically isolated.
  - Incoming air must contain at least 5% air from outside the Magnet room (inside or outside the facility) to displace residual helium.

- Emergency Vent Requirement
  - Exhaust vent system is supplied by the customer.
  - All items within the RF enclosure must be non-magnetic.
  - The exhaust vent system must be tested and operational before the magnet is installed.
  - The exhaust intake vent must be located near the magnet cryogenic vent at the highest point on the finished or drop ceiling.
  - The Magnet room exhaust fan and exhaust intake vent must have a capacity of at least 1200 CFM (34 m³/min) with a minimum of 12 room air exchanges per hour.
  - The exhaust fan must be placed above RF shielding located outside 10 gauss (1mT) and with appropriate waveguide.
  - The system must have a manual exhaust fan switch near the Operator Workspace and in the Magnet room near the door (the switches must be connected in parallel).
  - All system components must be accessible for customer inspection, cleaning and maintenance.

- Pressure Vent Requirement
  - A pressure equalizing vent is required in the magnet room ceiling or in the wall, at the highest point possible.
  - The vent minimum size must be (610 mm x 610 mm [24 in x 24 in]) or equivalent.
  - The pressure equalization vent must be located so any Helium gas is not vented into occupied areas.

Note: Location may affect acoustic noise transmission into occupied areas.

**NOTE**
- The customer must balance the cost of cryogens and local controls with the cost of emergency backup facility coolant.
- For the site without in-slab connection, the customer must provide and install an in-line thermometer on the supply facility coolant hose. The thermometer must be capable of visually displaying thermometer covering 41 to 59°F (5 to 15°C) and configured for the properties of the cooling fluid in use.

TYPICAL CRYOGENIC VENT PIPE DETAIL

Waveguide is contractor supplied. Minimum 812 mm [32 in]. Must extend at least 100 mm [4 in] on magnet room side of the wall/ceiling and 25±6 mm [1±0.25 in] from the GE supplied pipe below isolation joint. Magnet room end must not be more than 2969 mm [117 in] above finished floor.

1. The 203 mm [8 in] OD vent material must be one of the following materials with the wall thickness indicated:
   a. SS 304: Minimum 0.89 mm [0.035 in]; Maximum 3.18 mm [0.125 in]
   b. AL 6061-T6: Minimum 2.11 mm [0.083 in]; Maximum 3.18 mm [0.125 in]
   c. CU DWV, M or L: Minimum 2.11 mm [0.083 in]; Maximum 3.56 mm [0.140 in]
2. Either tubes or pipes may be used and must be seamless or have welded seams
3. Corrugated pipe or spiral duct must not be used
4. If required, bellows pipe less than 300 mm [12 in] in length may be used as a thermal expansion joint
5. The vent pipe must withstand the maximum pressure listed in the Pre-Installation Manual
6. Waveguide vent material must match the outside diameter of the magnet flanged vent adapter

TYPICAL CRYOGENIC VENTING (EXTERIOR)

KEY COMPONENTS:
- RF waveguide extended from wall to magnet adapter
- Must be all same material and all welded or brazed
- Support system must withstand 11125 N (2500 lbs)
- GE ventglas must be installed in vertical section directly over magnet

NOTE: for the Dielectric Break outside the Magnet room please see the Typical Cryogen Vent Pipe Detail

OUTSIDE WALL

VENT PIPE (customer supplied)

EXHAUST AREA 10.7m x 4.6m [35ft x 15ft] (LxW)

VENT CAP (customer supplied)

EXHAUST AREA 10.7m x 4.6m [35ft x 15ft] (LxW)

NOT TO SCALE

CRYOGENIC VENTING (EXTERIOR)

TYPICAL CRYOGEN SIDE WALL EXIT

Mesh bird screen

203 [8 in] ventglass outside RF room

NOTE: for the Dielectric Break outside the Magnet room please see the Typical Cryogen Side Wall Exit
### Notes

1. Elbows with angles greater than 90 deg must not be used.
2. Data in Table 2 is based on the following facts and assumptions:
   a. Initial flow conditions at magnet interface
   b. EM energy (13MJ) is dumped to He during quench and rises He temperature to 10 Kelvin
   c. Gas temperature starting at 10 Kelvin and increase with length determined by thermal energy balance
   d. 90% He is assumed to be evacuated within 30 sec. None left after quench.
   e. Absolute roughness is assumed to be 0.25 mm.
   f. R/D = 1.0 for standard sweep elbows, R/D = 1.5 for long sweep elbows where D = outer diameter of pipe; R = radius of bend
3. The total pressure drop of the entire cryogenic vent system must be less than 20 psi (138 kPa). The calculation starts at the magnet vent interface and ends at the termination point outside the building.
LIGHTING REQUIREMENTS

- All lighting fixtures and associated components must meet all RF shielded room and RF grounding requirements (e.g., track lighting is not recommended due to possible RF noise).
- All lighting must use direct current (the DC must have less than 5% ripple).
- 300 lux must be provided at the front of the magnet for patient access and above the magnet for servicing.
- Fluorescent lighting must not be used in the magnet room.
- Lighting must be adjusted using a discrete switch or a variable DC lighting controller.
- Scr dimmers or rheostats must not be used.
- DC led lighting may be used if the power source is located outside the magnet room RF.
- Battery chargers (e.g., used for emergency lighting) must be located outside the magnet RF room.
- Short filament length bulbs are recommended.
- Linear lamps are not recommended due to the high burnout rate.

CONNECTIVITY REQUIREMENTS

Broadband Connections are necessary during the installation process and going forward to ensure full support from the Engineering Teams for the customers system. Maximum performance and availability for the customers system is maintained and closely monitored during the lifetime of the system. Proactive and reactive maintenance is available utilising the wide range of digital tools using the connectivity solutions listed below:

- Site-to-Site VPN/GE Solution
- Site-to-Site VPN/Customer Solution
- Connection through Dedicated Service Network
- Internet Access - connectivity for InSite 2.0

The requirements for these connectivity solutions are explained in the broadband solutions catalogue (separate document).

ELECTRICAL NOTES

1. All wires specified shall be copper stranded, flexible, thermo-plastic, color coded, cut 10 foot long at outlet boxes, duct termination points or stubbed conduit ends. All conductors, power, signal and ground, must be run in a conduit or duct system. Electrical contractor shall ring out and tag all wires at both ends. Wire runs must be continuous copper stranded and free from splices.

1.1. Aluminum or solid wires are not allowed.
2. Wire sizes given are for use of equipment. Larger sizes may be required by local codes.
3. It is recommended that all wires be color coded, as required in accordance with national and local electrical codes.
4. Conduit sizes shall be verified by the architect, electrical engineer or contractor, in accordance with local or national codes.
5. Convenience outlets are not illustrated. Their number and location are to be specified by others. Locate at least one convenience outlet close to the system control, the power distribution unit and one on each wall of the procedure room. Use hospital approved outlet or equivalent.
6. General room illumination is not illustrated. Caution should be taken to avoid excessive heat from overhead spotlights. Damage can occur to ceiling mounting components and wiring if high wattage bulbs are used. Recommend low wattage bulbs no higher than 75 watts and use dimmer controls (except mr). Do not mount lights directly above areas where ceiling mounted accessories will be parked.
7. Routing of cable ductwork, conduits, etc., must run direct as possible otherwise may result in the need for greater than standard cable lengths (refer to the interconnection diagram for maximum usable lengths point to point).
8. Conduit turns to have large, sweeping bends with minimum radius in accordance with national and local electrical codes.
9. A special grounding system is required in all procedure rooms by some national and local codes. It is recommended in areas where patients might be examined or treated under present, future, or emergency conditions. Consult the governing electrical code and confer with appropriate customer administrative personnel to determine the areas requiring this type of grounding system.
10. The maximum point to point distances illustrated on this drawing must not be exceeded.
11. Physical connection of primary power to GE equipment is to be made by customers electrical contractor with the supervision of a GE representative. The GE representative would be required to identify the physical connection location, and insure proper handling of GE equipment.
12. GEHC conducts power audits to verify quality of power being delivered to the system. The customer’s electrical contractor is required to be available to support this activity.

- All junction boxes, conduit, duct, duct dividers, switches, circuit breakers, cable tray, etc., are to be supplied and installed by customers electrical contractor.
- Conduit and duct runs shall have sweep radius bends
- Conduits and duct above ceiling or below finished floor must be installed as near to ceiling or floor as possible to reduce run length.
- Ceiling mounted junction boxes illustrated on this plan must be installed flush with finished ceiling.
- All ductwork must meet the following requirements:
  1. Ductwork shall be metal with dividers and have removable, accessible covers.
  2. Ductwork shall be certified/rated for electrical power purposes.
  3. Ductwork shall be electrically and mechanically bonded together in an approved manner.
- PVC as a substitute must be used in accordance with all local and national codes.
- All openings in access flooring are to be cut out and finished off with grommet material by the customers contractor.
- General contractor to insert pull cords for all cable run conduits between the equipment room and the operators control room.
- 10 foot pigtail at all junction points.
- Grounding is critical to equipment function and patient safety. Site must conform to wiring specifications shown on this plan.

CABLE TRAYS REQUIREMENTS IN MAGNET ROOM

1 - Ceiling
2 - Finished Floor
3 - Magnet isocenter
4 - Minimum cable tray height required at back of Magnet: 2436 mm [95.9 in].
   Tray height may be lower at other points to avoid obstructions.
5 - Maximum height from floor to top of tray (anywhere in Magnet room): 3251 mm [128 in].
6 - Minimum distance from top of cable tray to ceiling: 2436 mm [95.9 in], minimum distance from top of cable tray to
   Obstruction: 178 mm [7 in].
7 - Tray end to isocenter: 1245 ±12 mm [49 ±0.5 in].
8 - Other cable termination to isocenter: 864 ±12 mm [34 ±0.5 in].
9 - Minimum distance between trays: 12 mm [0.5 in].
10 - Non-ferrous cable support
11 - The center of the gradient cable group is 89 mm [3.5 in] from the inside edge of the tray, in line with the magnet center.
POWER REQUIREMENTS

SPECIFICATIONS OF MAIN POWER INPUT

| POWER SUPPLY | 380/400/415/480V +7.5%/-10%, THREE-PHASE + GND |
| FREQUENCIES | 50/60Hz ± 3Hz |
| POWER FACTOR | 0.9 |
| MAXIMUM INPUT POWER (5 sec MAX) | 77kVA |
| CONTINUOUS (AVERAGE) POWER | 64kVA |
| STAND-BY POWER | < 17kVA |

- Power input must be separated from any others which may generate transients (elevators, air conditioning, radiology rooms equipped with high speed film changers...).
- Total harmonic distortion less than 2.5%.
- Phase imbalance must not exceed 2%.

SPECIFICATIONS OF BACK-UP POWER SUPPLY

FOR MAGNET MONITOR

| POWER INPUT | EMERGENCY POWER SUPPLY, SINGLE PHASE + GROUND |
| VOLTAGE | 110V / 220V |
| FREQUENCY | 50/60Hz ± 3Hz |

FOR CRYOCOOLER COMPRESSOR

| POWER INPUT | 380/400/415/480V, THREE-PHASE + G |
| POWER REQUIREMENT | MIN 9kVA |
| POWER CONSUMPTION | MAX 7.2kW / STEADY STATE 6.5kW at 50Hz |
| MAX 8.3kW / STEADY STATE 7.5kW at 60Hz |
| FREQUENCY | 50/60Hz ± 3Hz |

CABLES

- Power and cable installation must comply with the distribution diagram.
- Size of the Main power input cable is determined by the customer, taking its length and admissible voltage drops into consideration.
- All cables must be isolated and flexible, cable color codes must comply with standards for electrical installation.
- The cables from signaling and remote control (Y, Emergency Off Buttons, L...) will go to Main Panel with a pigtail length of 1.5m (60in), and will be connected during installation.
- Each conductor will be identified and isolated (screw connector).

GROUND SYSTEM

- The equipotential link will be by means of an equipotential bar.
- The grounding point of MDP is directly connected to the building’s ground by an isolated copper cable.
- The impedance of the earth bar should be less than or equal to 2 ohms.
- Grounding conductor will run from the equipment back to the power source/main grounding point and always travel in the same conduit with the feeders.
- Power and cable installation must comply with the distribution diagram.
- All cables must be isolated and flexible, cable color codes must comply with standards for electrical installation.
- The impedance of the earth bar should be less than or equal to 2 ohms.
- The grounding point of MDP provides power to customer provided circuit breakers for PDU (located in the Integrated Systems Cabinet (ISC)) and the Cryocooler Compressor (CRY).
- Two remote Emergency Off Maintained Buttons are supplied with the MDP. Emergency Off removes power from all outputs when activated.
- MDP provides power to customer provided circuit breakers for PDU (located in the Integrated Systems Cabinet (ISC)) and the Cryocooler Compressor (CRY).
- All MDP output circuits drop out on loss of power. The Cryocooler (CRY) circuit will automatically return upon restoration of power.
- GE MDP Short circuit current rating is 25,000 amperes at 480 VAC.
- GE MDP Short circuit current rating is 25,000 amperes at 480 VAC.
- GE MDP is NRTL labeled.
- All feeder circuits require dedicated ground wires.

POWER DISTRIBUTION

- Typical
- SIGMA PIONEER
- EN-MRI-TYP-SIGMA_PIONEER-WEB.DWG
- Rev B/Date: 23/Sep/2019
- ES - Power Requirements

In all cases qualified personnel must verify that the feeder (at the point of take-off) and the run to the MR system meet all the requirements stated in the PIM.

For a single unit installation, the minimum transformer size is 225KVA. Regulated transformer is not required unless voltage changes exceed +/- 10% over a period of 1 hour or longer.

Grounding conductor will run from the equipment back to the power source/main grounding point and always travel in the same conduit with the feeders.
Long / Short cable selection guidance

NOTE: This guidance is based on the assumption that the distance between cable tray and floor is 2.6 m [8.53 ft].

Magnet Room:
- If the Magnet – ISC Distance is less than 5.4 m [17.7 ft], select short cable.
- If the Magnet – ISC Distance is in between 5.4 m [17.7 ft] and 9.4 m [30.8 ft], select long cable.

Equipment Room:
- If the ICC – ISC Distance is less than 0.4 m [1.3 ft], select short cable.
- If the ICC – ISC Distance is in between 0.4 m [1.3 ft] and 6.4 m [21 ft], select long cable.
