

# Xeleris™ V

The industry-wide trend toward precision care is raising the standard of healthcare. It's also raising the standard on radiologists, adding pressure to create even more accurate, productive and reproducible results. This increased need for accuracy in turn increases the complexity of manual workflows like organ segmentation and dose calculations. Xeleris V makes it easy to efficiently and accurately complete organ segmentation in order to help meet the standard of precision care.

With Xeleris V, GE Healthcare's new virtual processing and review solution for nuclear medicine, we have removed the restraints of a dedicated processing and review station. Together with Smart Subscription and advanced AI applications powered by Edison™, we are transforming the way nuclear medicine works. Xeleris V is mobile, scalable, accessible, intelligent and always up to date. You can upgrade by purchasing Xeleris V outright or by acquiring it with Smart Subscription, our cutting-edge subscription service that keeps your systems synchronized to each other and to the latest software.

You'll find you can easily scale from multi-user to multi-site with Xeleris V, because we've cut the ties from your nuclear medicine applications to any specific hardware. Using the software-as-a-solution model, Xeleris V provides unrestricted access to applications, creating a virtual environment where you can easily scale Xeleris V from three to five to 10 concurrent users.
